modify torsion bar - weld on tab or tap and die? Posted by nkgosselin - 13 Jun 2009 08:24
If, when, I ever get my torsion bars. I want to modify them for easy removal. I've already drilled the holes in the bodywork.
So, is it preferred to weld a tab onto the bar or to tap it so that a bolt can be used?
Any concerns with weakening with either method?
Tapping would be easier for me as I don't weld.

the spring steel is hard to tap (strong stuff) so I have them weleded at DART Auto.
